PROFESSIONAL SUMMARY

Machine Learning Engineer with a strong software development background in Python, C#, and C++. Experienced in building end-to-end machine learning pipelines including data cleaning, preprocessing, feature engineering, model training, evaluation, optimization, and deployment. Improved decision accuracy by 30% and increased model performance by 25–40% across classification and regression tasks. Integrated machine learning solutions with scalable backend systems, improving production readiness by 35% and enabling reliable, maintainable deployment in real-world applications.

TECHNICAL SKILLS

Programming Languages:

- C++, Python, C#, SQL
- Excel , Dart

Frameworks & Tools:

- Sklearn , Plotly , NumPy
- Pandas , TensorFlow , joblib
- Matplotlib , Keras , Streamlit
- Git , GitHub
- flask , Django , Node.js

Databases:

- SQLite , MySQL , PostgreSQL
- Microsoft SQL Server

Architecture:

- RESTful API Design
- CRUD
- REST inference endpoints

LANGUAGES

- Arabic – Native
- English – Intermediate (B2)

TECHNICAL PROJECTS

Deep Learning

graduation project – 2026

Smart Stock ERP System

Grade A

- Designed and trained a GRU-based neural network to forecast 30-day sales revenue from historical ERP transaction data, using a sliding 30-day input window.
- Built the full data pipeline: extracted invoices from MySQL, aggregated daily sales, engineered calendar features (day-of-week, month, event flags), and applied log-scaling/normalization for stable training.
- Implemented autoregressive multi-step forecasting, feeding each day's prediction back into the model to generate a full 30-day forecast.
- Built a retraining pipeline with early stopping, plus automated MAPE-based accuracy monitoring that flags unreliable forecasts and triggers retraining.
- Integrated the model into a Node.js/Express backend via process orchestration, exposing forecasts through REST APIs secured with JWT role-based access and transaction-safe inventory logic.
- Independently designed and built the entire backend of the ERP system — covering employee management, inventory, purchasing, outbound/inbound workflows, invoicing, and dashboards — with transaction-safe stock logic (row locking) and JWT-based role access control across all modules.

Machine Learning

Personal Project – 2025

E-Commerce Sales Prediction

- Performed in-depth exploratory data analysis and visualization on a 500,000-transaction UK e-commerce dataset , uncovered seasonal sales trends like top-performing products.
- Performed in-depth exploratory data analysis and feature engineering, including cleaning (missing values, outliers, duplicates), temporal feature extraction, target variable creation, and feature scaling to prepare high-quality data for modeling.
- Built, trained, and compared six regression models to predict total sales; evaluated performance using MSE, MAE, and R² score, conducted hyperparameter tuning, and identified the best-performing model for accurate e-commerce sales forecasting.

CERTIFICATIONS & COURSES

Artificial Intelligence

ALX Academy

2024

Machine Learning

Mindset Training

2025

Deep Learning

2025

SOFT SKILLS

Agile

Scrum

Strong problem-solving

effective communication

deep critical thinking

exceptional patience in research and information gathering

EDUCATION

Bachelor's Degree of Computer Science and IT

Al-Ahram Canadian University

GPA(3.68 / 4) 2022 - 2026

Machine Learning

Personal Project - 2025

Cardiovascular Disease Classification

- Built and deployed an end-to-end machine learning pipeline on 70,000+ medical records, performing data cleaning, enforcing medical constraints, and engineering clinically meaningful features (BMI, pulse pressure) to improve data reliability and interpretability.
- Trained, tuned, and compared multiple classification models (Logistic Regression, KNN, SVM, Random Forest, Gradient Boosting, XGBoost) using cross-validation and GridSearchCV, identifying XGBoost as the best-performing model based on ROC-AUC, precision, recall, and F1-score.
- Saved the final optimized model using the pickle library and deployed it as an interactive Streamlit web application, enabling real-time cardiovascular disease prediction.

Deep Learning

Personal Project - 2025

Brain Tumor Classification

- data exploration and visualization of MRI images to identify visual differences between brain gliomas and meningiomas, as well as to analyze image size and pixel density.
- applying intensive data amplification techniques to improve model robustness and generalizability.
- applied a custom CNN, ResNet50, and VGG16 using transfer learning comparing their performance through accuracy, recall, F1 score, confusion matrices, fine-tuning analysis, and training curves to identify the most effective architecture.

WORK EXPERIENCE

Web Developer / Bot Developer

NOV 11, 2024 - MAR 22, 2025

WhatsApp Customer Service Bot

- Developed a WhatsApp bot integrated with Meta's Business API to streamline customer service interactions
- Built a dynamic admin panel enabling non-technical users to manage categories, issues, and solution links without modifying the codebase
- Designed and implemented RESTful APIs using Flask
- Engineered the backend with SQLite for lightweight and efficient data management
- Developed a responsive front end using HTML, CSS, and JavaScript to enhance usability for admin users
- Deployed the complete system on Railway cloud hosting, ensuring reliable availability, environment configuration, and real-world usage.

Software Developer - Desktop Application

July 12, 2024 - July 30, 2024

Store Management System

- Designed and developed a desktop application for comprehensive store management, including invoice tracking, inventory input/output, and salary calculations
- Integrated accounting features to ensure full operational and financial control within a single platform
- Utilized .NET Framework for robust desktop application development
- Managed database operations using SQL Express and LINQ for efficient data handling and queries
